Team Member	Component(s)	Specific Tasks Completed	Testing/Debugging	GitHub Contributions
Ruth	• **Headers:** Created header files declaring classes, data members, and function prototypes. • **Waiting List:** Designed a linked-list-based queue to manage waiting reservations in FIFO order. • **Cancellation History:** Developed a stack to store and display canceled reservations in LIFO order.	• Created header files for the assigned components. • Defined waiting-list nodes and queue function declarations. • Implemented cancellation-history push, pop, display, and memory cleanup functions.	• Reviewed header declarations and data-structure operations. • Identified syntax and initialization errors in the cancellation-history code. • Reviewed empty-stack handling and dynamic memory cleanup.	• Contributed header files and implementation code for the waiting list and cancellation history. • Supported code organization and integration into the shared project repository.

Michaela	Reservation Management, Reservation validation, Counting functions	• Implemented reservation creation, validation, searching, cancellation, and restoration. • Added counting functions to support reservation reports. • Implemented linked-list insertion, deletion, and cleanup. • Prevented duplicate	• Reviewed reservation validation and duplicate ID prevention. • Checked linked-list operations and counting logic. • Investigated the `undefined reference to main` linker error. • Reviewed reservation restoration and memory cleanup.	• Updated `ReservationManager.h` and `ReservationManager.cpp`. • Implemented reservation management and reporting-support functions. • Organized reservation logic and investigated compilation issues.

		reservation IDs.		
Janiya	Resource Management, Searching and Sorting	Created the Resource and ResourceManager classes, implemented the functions for loading and displaying the resources, created a linear search function for resource IDs, used Merge Sort for alphabetically ordering the resources, added the sorting functionality to the main menu, and contributed to the README.	Performed tests on the resource loading, showed five resources, checked the validity/invalidity of the resource IDs, tested the alphabetical sorting, fixed syntax errors, and compiled the program using the UNT CELL servers. Also researched compilation errors caused by discrepancies between Resource.h and Resource.cpp.	Worked on the feature/resource-management branch; committed changes to the resource management part and README; and pushed the implementation of Merge Sort into the menu to GitHub.

Below the table, include a short paragraph for each team member describing their individual contribution in more detail.

Team Member: Ruth Omoyi

I worked on creating the header files and developing the waiting list and cancellation history features for our project. I set up the class structures, variables, and function

declarations needed for each component. For the waiting list, I used a linked list to keep track of students waiting for resources in the order they were added. I also worked on the cancellation history, which uses a stack to store and display canceled reservations. Additionally, I included memory management to help prevent memory leaks when removing nodes. These components help keep the reservation system organized and make it easier to manage waiting reservations and track cancellations.

Team Member: Michaela Bosmans

My main contribution to the Campus Resource Reservation System was working on the reservation management portion of the project. I helped implement the functions that allow users to create, search for, cancel, and restore reservations. I also added counting functions to track active reservations, reservations by resource, and reservations by student for reporting purposes. Another part of my work involved making sure reservation information was valid and preventing duplicate reservation IDs. I also worked on managing the linked list and making sure memory was properly cleaned up. Overall, I focused on making the reservation system more organized, reliable, and functional while helping identify and troubleshoot coding issues.

Team Member: Janiya Maduagwu

Resource Management was my key duty for this assignment. I worked with the Resource class and the ResourceManager class in order to assist with the application to read, save, display, and search for the resources within the campus. In addition, I did a linear search in order to determine whether the ID of the resource is available or not. I used Merge Sort to sort the resources alphabetically according to their names. Upon successful completion of the sorting functionality, I made this part visible in the main menu. During testing phase, I used the UNT CELL servers to compile my code, to test the resource information, and to ensure the sorting functionality works properly. Moreover, I rectified the coding mistakes as well as assisted in the identification of problems in the interface between the resource header and implementation files due to the newly added changes.
